A Message from the Pennsylvania American Water President

Dear Valued Customer:

On behalf of all Pennsylvania American Water employees, I am pleased to share with you another excellent annual report on the quality of your drinking water. This Water Quality Report provides the results of local water testing between January and December 2018. As you will see, we continue to supply your community with water that meets or surpasses all regulatory standards.

Water service from Pennsylvania American Water is an exceptional value. To deliver quality water to your tap, we employ a great deal of science, expertise, technology and infrastructure to bring water from the source, treat it and ensure it is clean and safe. In addition, our plant operators, water quality experts, engineers and maintenance crews work around the clock to make sure reliable water service is always there when you need it.

Delivering high-quality water service also requires significant investment to replace and upgrade aging pipe, equipment and facilities. In 2018 alone, we invested nearly $352 million in system improvements across the Commonwealth. We also remain committed to protecting our drinking water supplies, and we continue to support efforts to improve our watersheds and use advanced technology to monitor the quality of our water sources.

Water is essential for public health, fire protection, economic development and our overall quality of life. Every Pennsylvania American Water employee takes this responsibility very seriously and works hard to keep life flowing today and for the next generation. We hope that our commitment to you and our passion for water shines through in this report, and we encourage you to take the time to read more about the source and quality of your drinking water.

Proud to be your local water service provider,

Jeffrey L. McIntyre
President, Pennsylvania American Water
Our Mark of Excellence
With a history dating back to 1886, American Water is the largest and most geographically diverse U.S. publicly traded water and wastewater utility company. The company employs more than 7,100 dedicated professionals who provide regulated and market-based drinking water, wastewater and other related services to more than 14 million people in 46 states and Ontario, Canada. American Water provides safe, clean, affordable and reliable water services to our customers to make sure we keep their lives flowing. For more information, visit amwater.com and follow American Water on Twitter, Facebook and LinkedIn.

Pennsylvania American Water, a subsidiary of American Water, is the largest investor-owned water utility in the state, providing high-quality and reliable water and/or wastewater services to approximately 2.4 million people.

We are once again proud to present our annual water quality report. This edition covers all testing completed from January through December 2018. Over the years, we have dedicated ourselves to producing drinking water that meets or surpasses all state and federal drinking water standards. We continually strive to adopt new and better methods of delivering the best quality drinking water to you. As regulations and drinking water standards become more stringent, it is our commitment to you to ensure compliance with these standards in an expeditious and cost-effective manner, while maintaining our objective of providing quality drinking water at an affordable price. We are pleased to tell you that our compliance with all state and federal drinking water laws remains exemplary. To that end, we remain vigilant in meeting the challenges of source water protection, water conservation, and community education while continuing to serve the needs of all our water users.

For more information about this report, or for any questions relating to your drinking water, please feel free to call our Customer Service Department at 1-800-565-7292.

Your Drinking Water Supply
The raw drinking water supply is groundwater from four wells in Delaware Township, Pike County. The area lies within the Raymondskill Creek watershed, a sub-basin of the Delaware River Watershed. Learn more about local groundwater conditions at https://water.usgs.gov/ogw.

The Pennsylvania Department of Environmental Protection (DEP) completed a source water assessment for the Wild Acres System in 2005 to meet Federal requirements of the Safe Drinking Water Act. The study looked at the drainage area and ranked its vulnerability to contamination. The water supplies are considered vulnerable to runoff from residential developments, agricultural lands, and roadways. To get a copy of the assessment, contact DEP at (717) 705-4732 or visit: http://www.depgreenport.state.pa.us/elibrary/

Protecting Your Drinking Water Supply
Protecting drinking water at its source is an important part of the process to treat and deliver high quality water. It takes a community effort to protect our shared water resources. This includes utilities, businesses, residents, government agencies and organizations. Everyone who lives, works, and plays in the area has a role and stake in clean water supplies.

What Can You Do? Quality drinking water starts upstream. Everyone can help maintain and improve drinking water supplies through the following actions:

- Dispose of pharmaceuticals, household chemicals, oils and paints at proper waste collection sites. Materials can impact water ways if poured down the drain, flushed down the toilet, or dumped on the ground. Contact your county waste authority to find out how to dispose of these materials properly.
- Check for leaks from automobiles and heating fuel tanks. Clean up any spills using an absorbent material like cat litter. Sweep up the material and put it in a sealed bag in the trash.
- Clean up after your pets and limit the use of fertilizers and pesticides.
- Look for local opportunities to take part in watershed activities.
• Report any spills, illegal dumping or suspicious activity to DEP here: https://www.dep.pa.gov/About/ReportanIncident/Pages/default.aspx

**What Are We Doing?** Our vision is *Clean Water for Life*. Our priority is to provide reliable, quality drinking water for our customers. The source of supply is an important part of that mission. We work to understand and reduce potential risks to your drinking water supply.

We review potential sources of contamination in the area on an annual basis. Our next step is to develop a Source Water Protection Plan under the Pennsylvania Source Water Protection Technical Assistance Program (SWPTAP). This is a voluntary program to identify and address potential threats to drinking water supplies. Stakeholder involvement is an important part of the program. We will partner with DEP to seek input and review progress on the plan with stakeholders. We also welcome input on the plan or local water supplies through our online feedback form.

Here are a few of the efforts underway to protect our shared water resources:

• **Community Involvement**: We have a proactive public outreach program to help spread the word and get people involved. This includes school education, contests, and other community activities. For more information, visit: [https://amwater.com/paaw/news-community/community-involvement](https://amwater.com/paaw/news-community/community-involvement)

• **Environmental Grant Program**: Each year, we fund projects that improve water resources in our local communities. In 2018, six organizations received grant funds totaling around $40,000 for local watershed projects. For more information on the program, visit: [https://amwater.com/paaw/news-community/environmental-grant-program](https://amwater.com/paaw/news-community/environmental-grant-program).

• **Pharmaceutical Collection**: We sponsor drop box locations across the Commonwealth for residents to safely dispose of unwanted drugs for free. This helps keep pharmaceutical products from entering water supplies. For drop box locations near you, visit: [https://amwater.com/paaw/water-quality/pharmaceuticals-and-drinking-water](https://amwater.com/paaw/water-quality/pharmaceuticals-and-drinking-water).

To learn more about your water supply and local activities, please contact the regional Source Water Protection Lead, Kristi English at 717-550-1508.

**Other Water Quality Parameters of Interest**

**Is there lead in your water?**

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Pennsylvania American Water is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at: [U.S. Environmental Protection Agency Web Page on Lead](https://www.epa.gov/water-leadsafe/lead-resource-center).

We take steps to reduce the potential for lead to leach from your pipes into the water. This is accomplished by maintaining the quality of your water leaving our treatment facilities. There are steps that you can take to reduce your household’s exposure to lead in drinking water. For more information, please review our Lead and Drinking Water Fact Sheet: [https://amwater.com/paaw/water-quality/lead-and-drinking-water](https://amwater.com/paaw/water-quality/lead-and-drinking-water)

*Pennsylvania American Water is currently updating our customer records to identify homes with lead service lines or homes with copper pipes and lead solder installed between 1983 and 1988. If your home meets either criteria or you’re not sure, please contact Nat Lussi at 570-588-9502 or email at Nat.Lussi@amwater.com.*
Does your water contain nitrates?
PAW’s normal range of nitrate levels is well below the MCL of 10 ppm. Nitrates enter the water supply from fertilizers used on farms and natural erosion of deposits in the watershed.

Levels above 10 ppm are a health risk for infants under six months of age and can cause blue baby syndrome. Check with your physician if you have questions.

How hard is your water?
Hardness is a measure of the concentration of primarily two minerals naturally present in water – calcium and magnesium. High hardness levels cause soap not to foam as easily as it would at lower levels and may deposit scale on pipes. The hardness levels measured in the distribution system ranged from 40 to 98 ppm, or 2 to 6 grains per gallon of water. Based on typical averaged hardness levels the water is classified as slightly to moderately hard.

How much sodium is in your water?
The sodium level measured in the water leaving the treatment facilities averaged approximately 16 ppm with the individual locations ranging from 6 to 27 ppm. Although the amount of sodium in drinking water is insignificant compared to the sodium normally consumed in the average diet, it does become a concern to people on low sodium diets recommending less than 20 ppm intake from drinking water. High levels of salt intake may be associated with hypertension in some individuals. To reduce the risks of adverse health effects due to sodium, consult a physician or registered dietitian to plan a healthy diet that reduces the sodium content in your total food intake.

What is the pH (acidity) range of your water?
Water produced by the three treatment facilities averaged 7.3 pH units. The pH at all three facilities ranged from 6.6 to 7.9 pH units throughout the year. A pH of 7.0 is considered neutral, neither acidic nor basic.

Is there fluoride in your water?
Pennsylvania American Water does not add fluoride to your water supply.

How to Contact Us

Substances Expected to be in Drinking Water
In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (EPA) prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Pennsylvania American Water’s treatment processes are designed to reduce any such substances to levels well below any health concern and the processes are controlled to provide maximum protection against microbial and viral pathogens which could be naturally present in surface and groundwater. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses
a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. Environmental Protection Agency’s Safe Drinking Water Hotline at (800) 426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants may be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the EPA’s Safe Drinking Water Hotline at (800) 426-4791.

The source of drinking water (both tap water and bottled water) includes rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial Contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic Contaminants, such as salts and metals, which can be naturally occurring or may result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and Herbicides, which may come from a variety of sources, such as agriculture, urban storm water runoff, and residential uses.

Organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and may also, come from gas stations, urban storm water runoff, and septic systems.

Radioactive Contaminants, which can be naturally occurring or may be the result of oil and gas production and mining activities.

How to Read This Table

Starting with a Substance, read across. Year Sampled is usually in 2018 or prior depending on the frequency required by the regulations. MCL shows the highest level of substance (contaminant) allowed. MCLG is the goal level for that substance (goal may be set lower than what is allowed). Highest Amount Detected represents the measured amount (less is better). Range tells the highest and lowest amounts measured. A Yes under Compliance Achieved means the amount of the substance met government requirements. Typical Source tells where the substance usually originates.

Non-regulated substances are measured, but maximum allowed contaminant levels have not been established by the government. These contaminants are shown for your information.

Definitions of Terms Used in This Report

AL (Action Level): The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements, which a water system must follow.

Entry Point (EP): A point at which finished water representative of each source enters the distribution system.

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG (Maximum Contaminant Level Goal): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MRDL (Maximum Residual Disinfectant Level): The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MRDLG (Maximum Residual Disinfectant Level Goal): The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

NA: Not applicable
ND: Not detected

pCi/L (picocuries per liter): Measurement of the natural rate of disintegration of radioactive contaminants in water (also beta particles).

ppm (parts per million): One part substance per million parts water, or milligrams per liter.

ppb (parts per billion): One part substance per billion parts water, or micrograms per liter.

SS: Single sample
%

90th Percentile: The highest concentration of lead or copper in tap water that is exceeded by 10 percent of the sites sampled during a monitoring period. This value is compared to the lead and copper action level (AL) to determine whether an AL has been exceeded.

Water Quality Statement
We are pleased to report that during calendar year 2018, the water delivered to your home or business complied with all state and federal drinking water requirements. For your information, we have compiled a list in the table below showing what substances were detected in your drinking water during 2018. The Pennsylvania DEP allows us to monitor for some contaminants less than once per year because the concentration of the contaminants does not change frequently. Some of our data, though representative, are more than one year old. Although all of the substances listed below are under the Maximum Contaminant Levels (MCL) set by the U.S. Environmental Protection Agency and the Pennsylvania DEP, we feel it is important that you know exactly what was detected and how much of each substance was present in the water.

Additional monitoring was also conducted in 2018 such as Inorganic Contaminants (IOCs), Synthetic Organic Contaminants (SOCs), Volatile Organic Contaminants (VOCs), and Nitrite. There were no detections of any of these substances as all results were non-detect.

Water Quality Results
Regulated Substances (Measured on the Water Leaving the Treatment Facilities)

</tr>
</tbody>
</table>

² MRDL (maximum residual disinfectant level) applies. Routine samples were collected and analyzed on a monthly basis at three locations within the distribution system. An average was then obtained from all cumulative sampling results for each month. The Results column lists the highest monthly average calculated and reported for 2018. The Range column represents the range of monthly average results reported for compliance during the entire year.

### Regulated Compounds (Measured on the Water in the Distribution System)

<table>
<thead>
